

JetTrac DataTrans

Converts any ASCII data stream
to XML for Adobe LiveCycle ES

Meet the XML Challenge!

One of the biggest challenges that some customers have when moving to LiveCycle ES is that they can't supply XML data streams from their current business applications. JetTrac DataTrans solves that problem by giving LiveCycle ES a tool that provides a path for them to feed their current data streams to LiveCycle ES.

JetTrac DataTrans runs within LiveCycle ES and takes your current data stream and converts it into an XML stream that will access and leverage all of the advanced features that LiveCycle ES has to offer.

Easy Conversions

For those who are moving to LiveCycle ES from Central Pro or other legacy systems, the lack of ASCII input in LiveCycle presents a challenge. New LiveCycle users need to figure out how to get their data into XML format in order to be able to use it with LiveCycle ES. JetTrac DataTrans meets that challenge, allowing those with legacy systems to use LiveCycle with full compatibility and integration.

Powerful Flexibility

JetTrac DataTrans uses a Stream Identification File, or SIF, to precisely identify all of the data field locations and what to call each field name. This allows you to have full flexibility in the way your LiveCycle ES form is built. It does not need to resemble or be laid out the same as your legacy data stream. There is no limit to the number of applications you can have with JetTrac DataTrans because of the flexibility of the SIF file. You can have a separate SIF file for as many applications as you want and customize each for each document that will use JetTrac DataTrans. The cost for the JetTrac DataTrans license is the same no matter how many applications you use it with on your LiveCycle ES server.

Adobe LiveCycle ES

With Adobe® LiveCycle® Output ES software, you can generate, assemble, and deliver personalized documents in print or electronic formats such as contracts, welcome packages, quotations, or shipping labels. Merge data from back-end systems with XML-based document templates to generate documents in PDF, PDF/A, PostScript®, PCL, or Zebra label formats. Customize document packages by combining newly generated PDF files with existing files from document repositories. Or, convert PDF files to print or image file formats, and then route automatically to support unattended printing or archiving operations. Personalized documents improve the quality and accuracy of communications with customers, partners, or suppliers while reducing the demand on employees to manually compile and deliver documents.
